Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1. (Previously Presented An evaporative cooler including a water distribution system comprising:
- a housing having a top, a bottom, a front panel, a rear panel and a first and second side extending between the front and rear panels;
- at least one media cabinet being movable in and out of an area defined by the top, bottom, front and rear panels the housing, the media cabinet having a longitudinal axis extending between the top and bottom; and
- a rigid media being removably received in the media cabinet along the longitudinal axis;

wherein the media cabinet is pivotally coupled to the housing allowing the media cabinet to pivot outward of the housing between a vertical position to a non-vertical position, the media cabinet including a cover being removable from the media cabinet and being separate from the housing.

- 2. (Original) The apparatus of claim 1, wherein the media cabinet includes a bottom panel, a front wall and a rear wall having an inner edge and an outer edge, a side wall extending between the front and rear walls proximate the outer edge.
- 3. (Original) The apparatus of claim 2, wherein the media cabinet includes a pair of flanges extending from the inner edges of the front and rear wall respectively toward one another.
- 4. (Original) The apparatus of claim 3, wherein the rigid media is located between the pair of flanges and the side wall in an in-use position.
- 5. (Original) The apparatus of claim 4, wherein the rigid media is supported by the bottom panel in the in-use position.
 - 6. (Canceled).

- 7. (Original) The apparatus of claim 4, wherein the media cabinet is pivotally coupled to the housing proximate a bottom region of the media cabinet along an axis perpendicular to the front and rear walls of the housing.
- 8. (Original) The apparatus of claim 7, wherein the media cabinet includes a support leg extending from the bottom panel, the support leg being configured to rest upon a base panel of the housing to at least partially support the media cabinet.
- 9. (Original) The apparatus of claim 7, wherein the housing includes a removable top portion to provide cover provides access to the rigid media in a vertical position.
- 10. (Original) The apparatus of claim 1, wherein the media cabinet includes a side panel having at least one opening configured to allow air to enter therethrough.
 - 11. (Previously Presented) An evaporative cooler comprising:
- a housing including a front panel and an opposing rear panel configured to be attached to a building structure, the housing further including a first and second side extending between the front and rear panels;
 - a blower located within the housing;
- a first and second evaporative media pad proximate the first and second sides of the housing respectively;
- a water distribution system including a water pump configured to pump water to at least one nozzle located above the media pads to permit water to flow downwards through the pads; and
- a first and second media cabinet coupled to the housing and movable from a vertical in-use position to a non-vertical position, the first and second evaporative media pads being removably received in the first and second media cabinets respectively;
- wherein each media cabinet <u>includes a downwardly extending flange being</u>
 <u>supported on the housing about which the media cabinet</u> is pivotally coupled to the housing allowing each media cabinet to <u>pivot outward of the housing between a vertical position to a non-vertical position to be removed from the housing.</u>

- 12. (Canceled).
- 13. (Original) The apparatus of claim 11, wherein the first and second media pads are rigid media pads.
- 14. (Original) The apparatus of claim 13, wherein each media cabinet includes a side wall facing outward, a front wall and a rear wall.
- 15. (Original) The apparatus of claim 14, wherein each media cabinet includes a pair of flanges extending inwardly distal the first and second sides of the housing respectively.
- 16. (Original) The apparatus of claim 15, wherein in an in-use position, the rigid media pads are located between the pair of flanges and the side wall.
- 17. (Previously Presented) An evaporative cooler comprising:
 a housing, a blower, an evaporative media, and a media wetting system;
 a media cabinet including a front wall and a rear wall having an inner edge and
 an outer edge, a side inlet wall extending between the outer edges of the front and rear walls,
 and a first and second flange extending inwardly toward one another from the front and rear
 walls respectively, the media cabinet extending across an entire width of the housing;

wherein, a cavity region is defined by the front and rear walls and the first and second flanges and the side inlet wall to support the media pad in a vertical in-use position; and

a pivot about which the orientation of the media can be changed from a vertical to a non-vertical position, the media cabinet being removable from the housing by lifting the media cabinet from the housing.

- 18. (Original) The apparatus of claim 17, wherein the media pad is rigid.
- 19. (Original) The apparatus of claim 18, wherein the media cabinet is pivotally coupled to the housing allowing the media cabinet to pivot outward of the housing between a vertical position to a non-vertical position.

20. (Original) The apparatus of claim 19, wherein the media cabinet is pivotally coupled to the housing proximate a bottom region of the media cabinet along an axis perpendicular to a front and rear panel of the cooler housing.
